50 25 0 50 100 Kilometres

Methodology

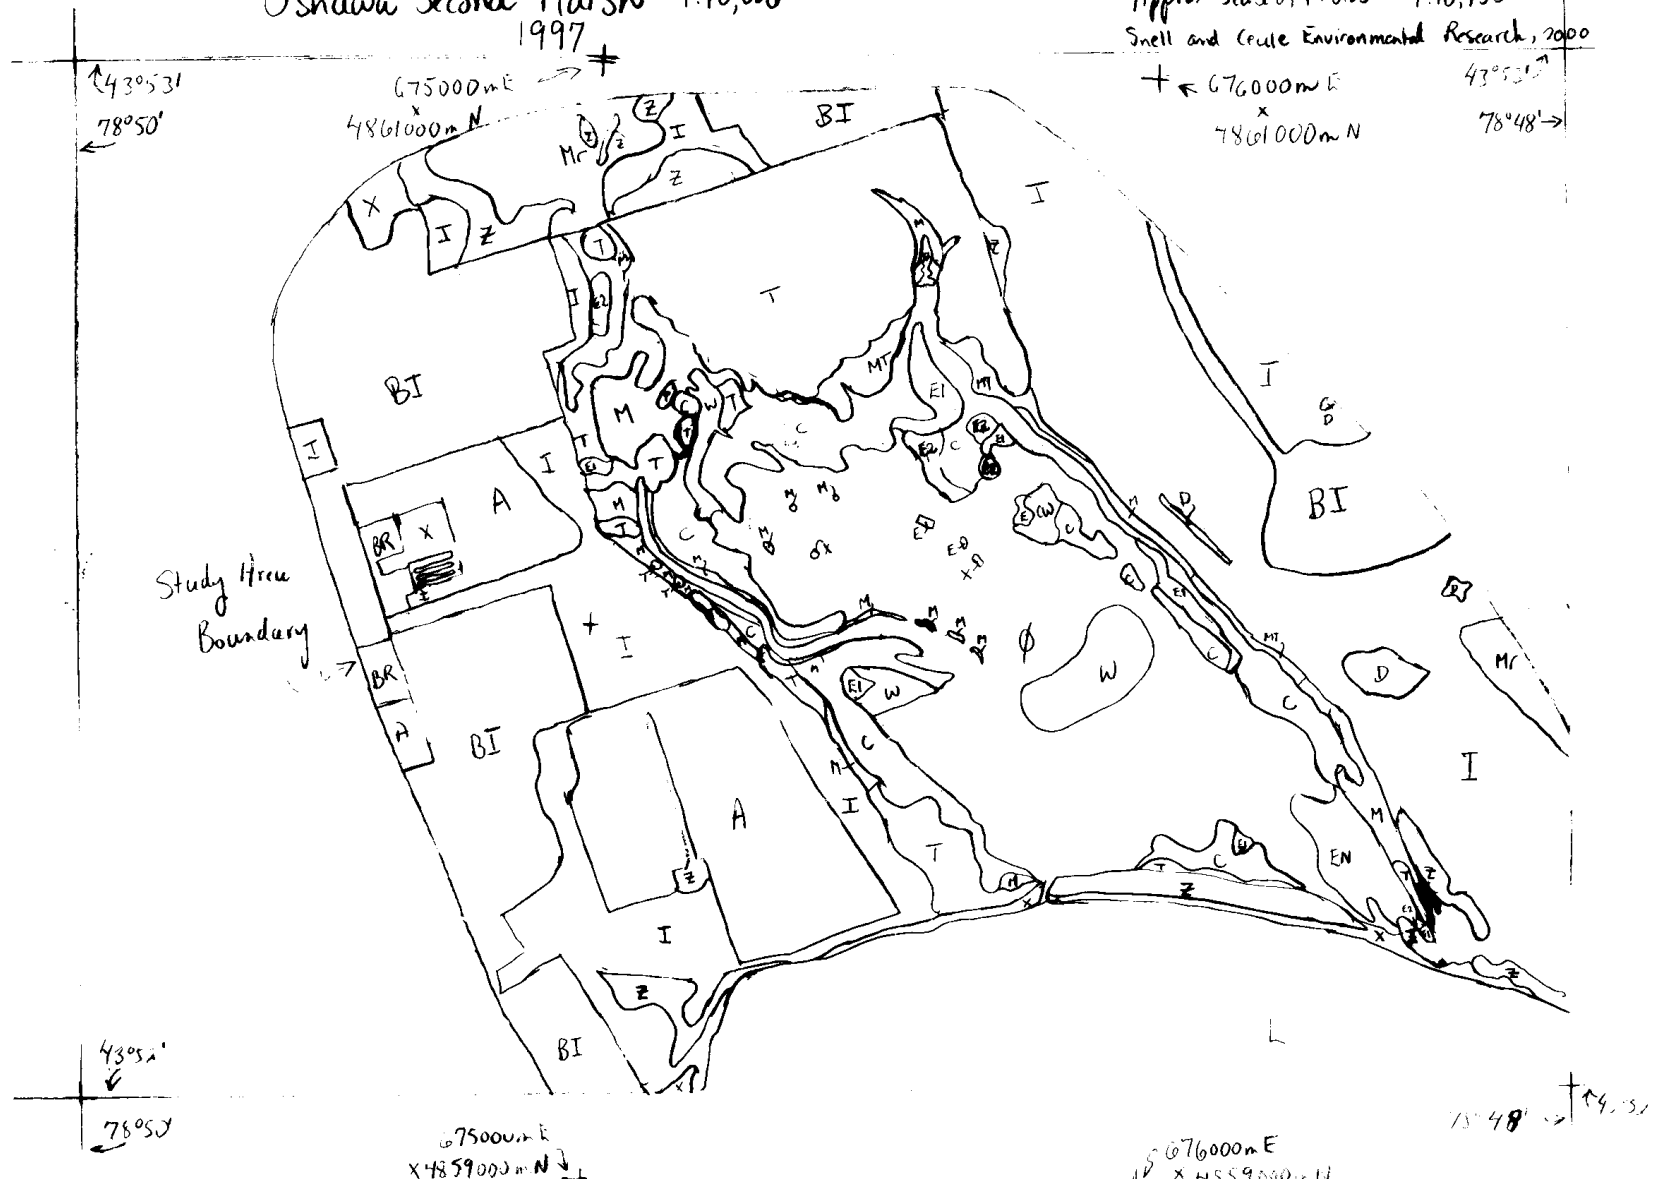

- Collect and digitize wetland classification maps into a Geographic Information System (GIS)
- Simplify the wetland classification scheme
- Quantify and characterize spatial and temporal changes in wetland vegetation over time and in relation to water level conditions
- **Simulate wetland vegetation response to historic and projected future water levels**

Final Product

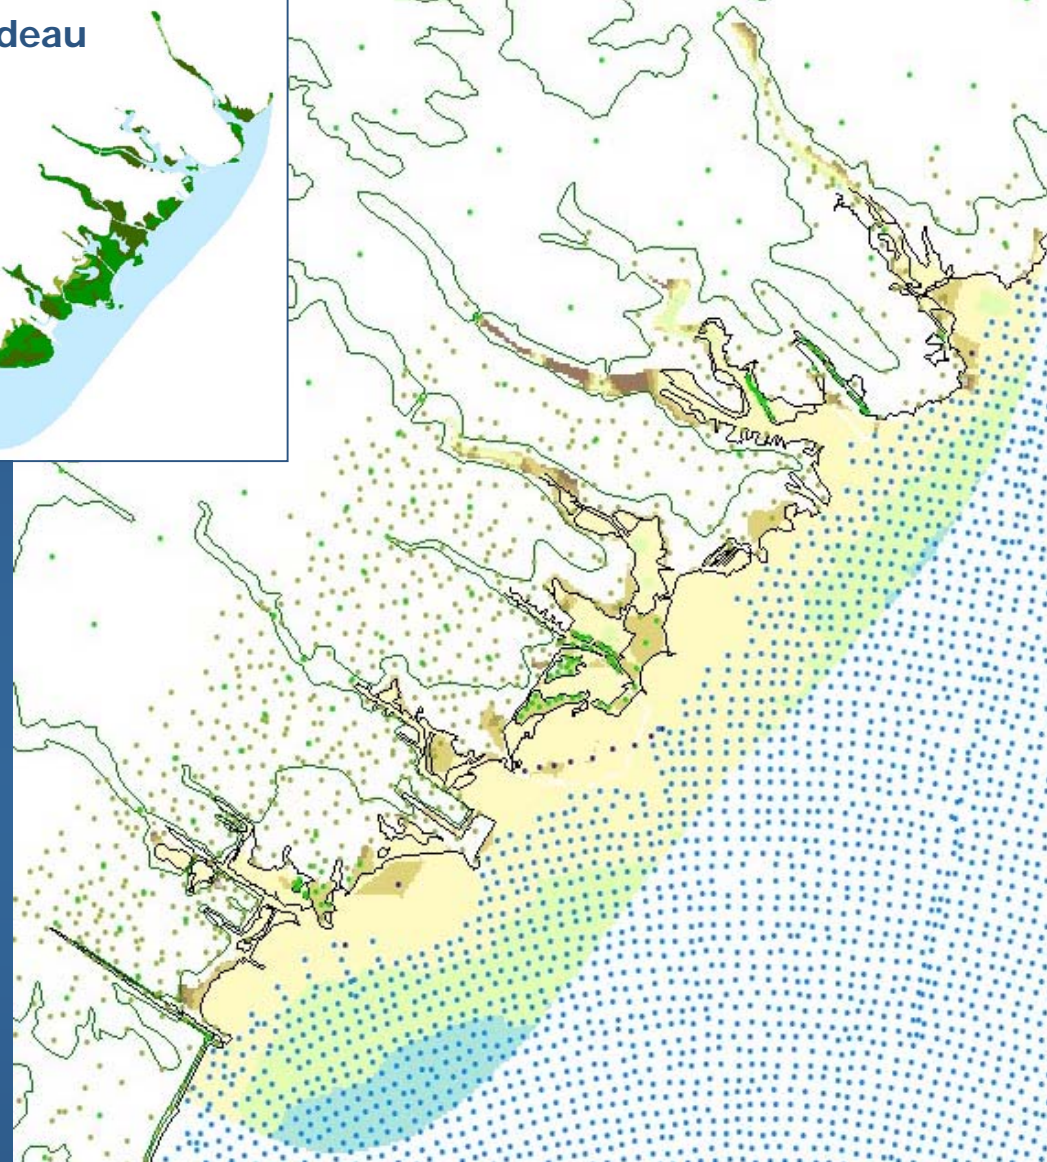

Vegetation Modelling

- Construct topographic models for each wetland site
- Construct a rule-based vegetation community response model
 - Consider water depth and duration of hydrologic condition
 - Validate with historical wetland data
- Apply climate change scenarios to model future vegetation response
- Apply vegetation output as input for bird and fish modelling

Topographic Models

- Compiled using:
 - Bathymetry Data
 - Digital Terrain Modelling (DTM) Points
 - Ontario Base Map (OBM) Spot & Contours
 - Ocean Surveys Inc (OSI) data
 - Flood Damage Reduction Program
- Generated a TIN then a LATTICE (linear option)

Elevation (m IGLD85)

Model Results - LP, 1964 (Low)

Actual

Modelled

Wetland Communities

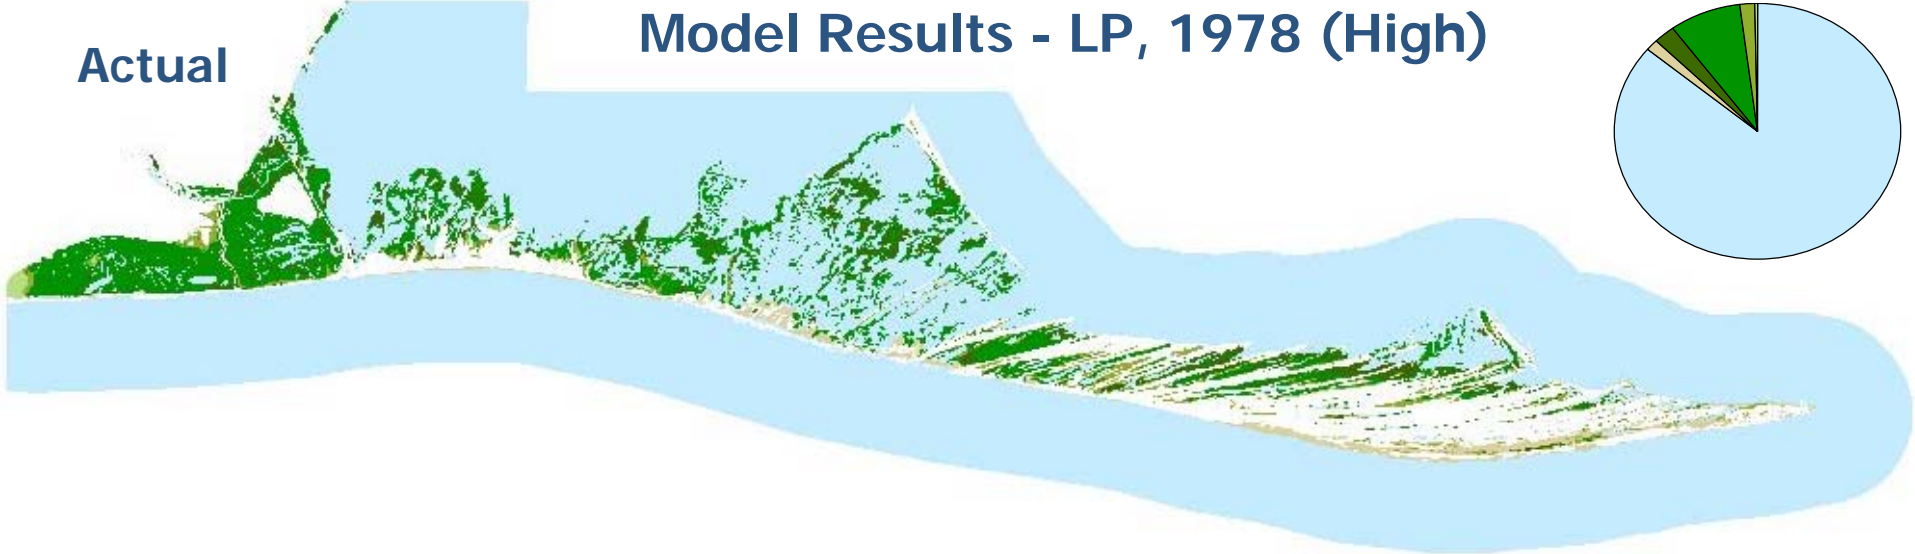

Model Results

- Spatial accuracy: 81.0%
- Good success with water, emergent
- Moderate success with meadow, treed
- No floating; emergent, treed overestimated; water underestimated

Model Results - LP, 1978 (High)

Actual

Modelled

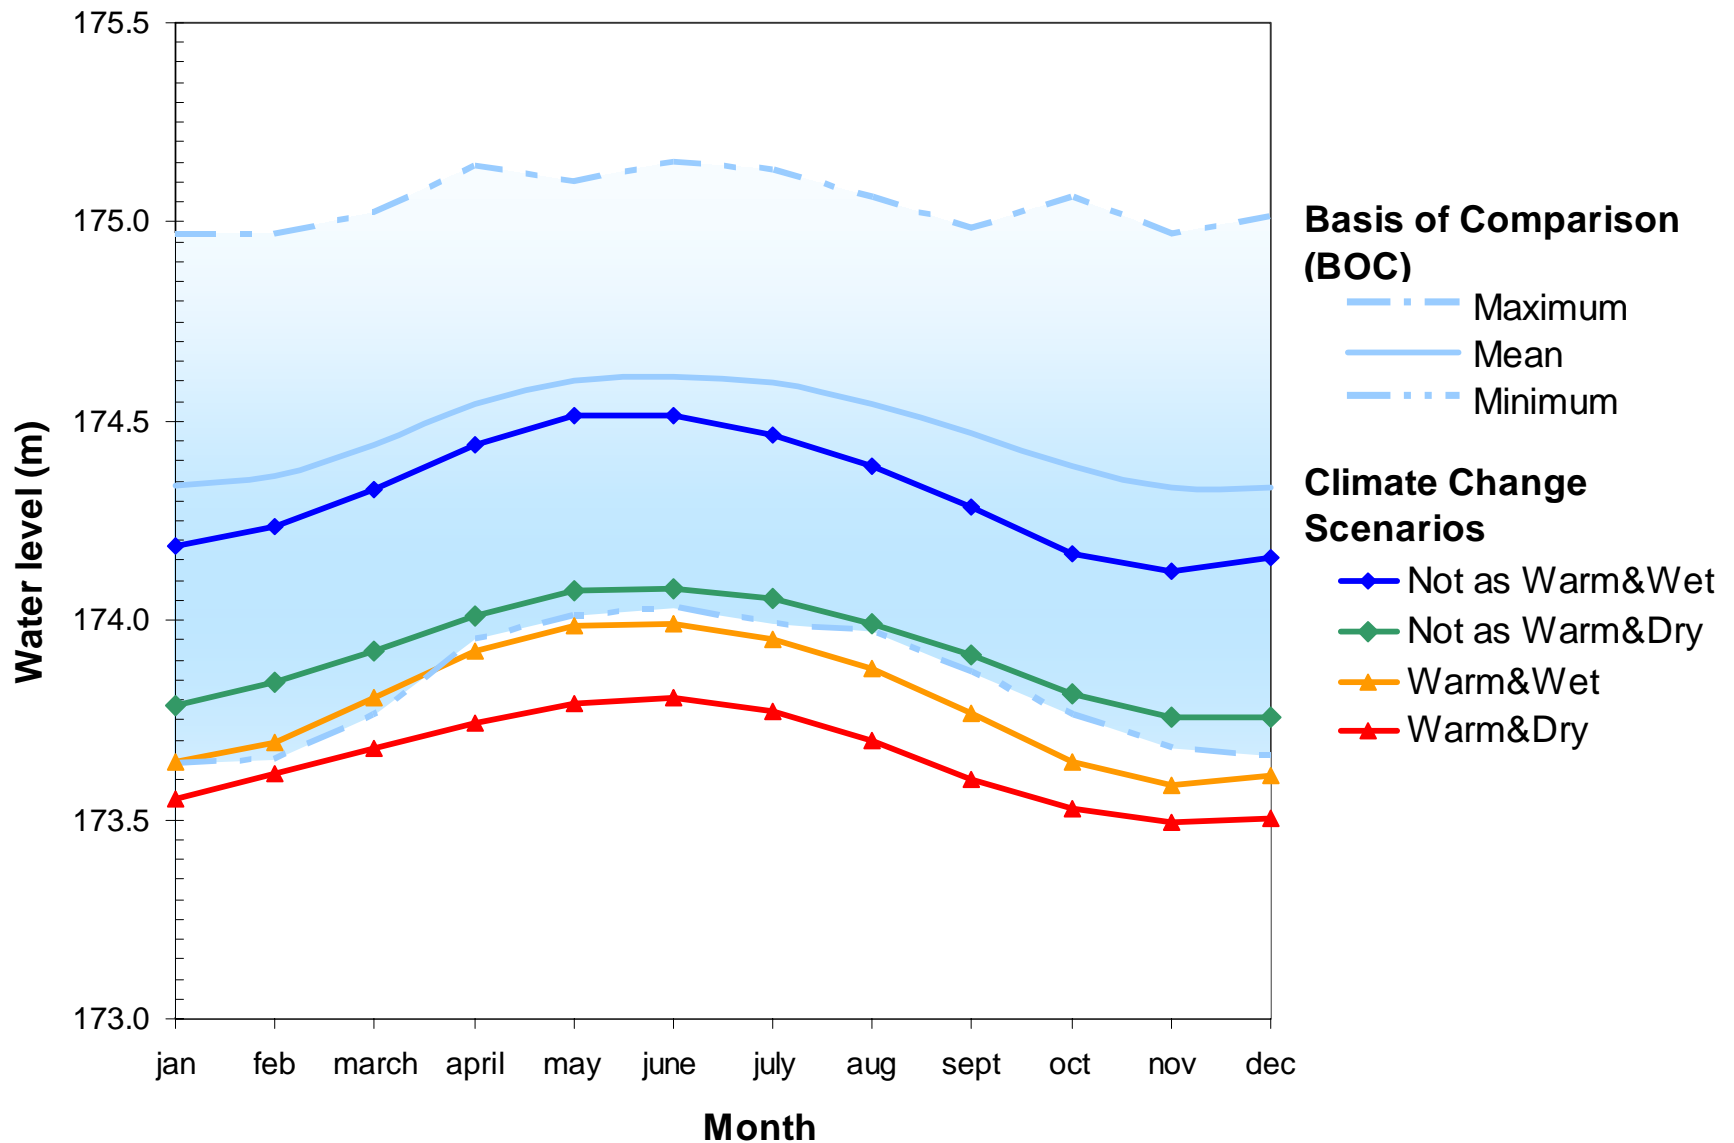

Wetland Communities

Model Results

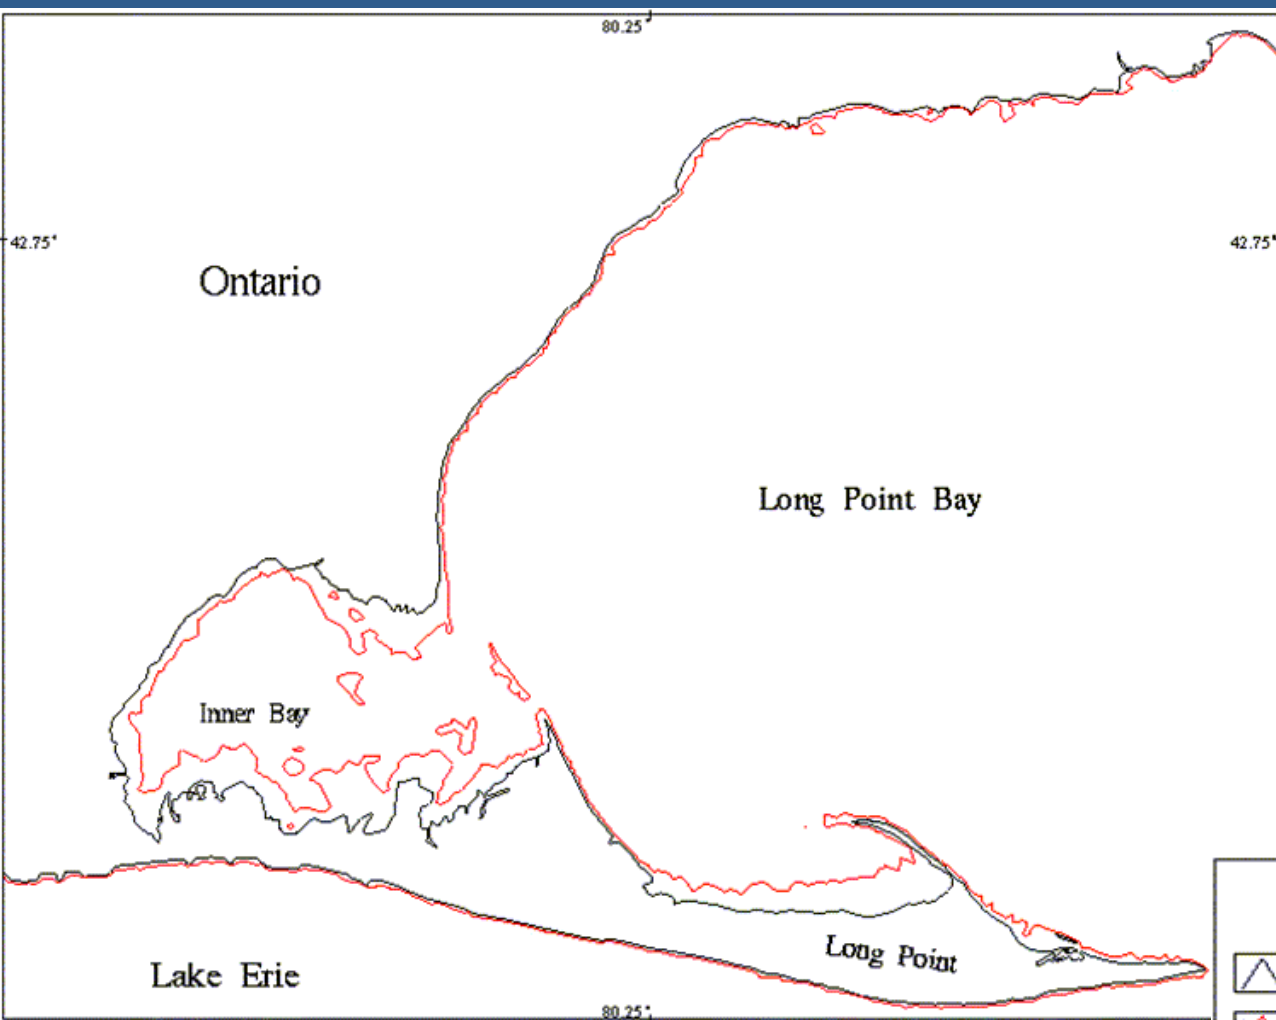

- Spatial accuracy: 87.5%
- Good success with water, emergent
- Moderate success with treed/shrub
- No floating or exposed; emergent, treed overestimated; meadow underestimated

Lake Erie Water Level Scenarios

Lake Erie (Long Point) "What-if" Scenario

- **1.48 m (IGLD85)** water level decline
- Surface area of Inner Bay reduced by **32 %**
- Shoreline moves from **0.2 km to greater than 2 km**

Map Legend

-  Current Lake Erie Shoreline
-  Altered Climate Lake Erie Shoreline

Projected Climate Change - LP, 1978 (High)

Historic Base Case

Wetland Communities

Projected Climate Change - LP, 1978 (High)

Not as Warm and Wet

Wetland Communities

Projected Change (-0.15 m)

- Increase in Emergent
- Decrease in Water

Projected Climate Change - LP, 1978 (High)

Not as Warm and Dry

Wetland Communities

Projected Change (-0.55 m)

- Increase Emergent, Treed
- Decrease in Water
- Lakeward Migration

Projected Climate Change - LP, 1978 (High)

Warm and Wet

Wetland Communities

Projected Change (-0.67 m)

- Increase in Emergent, Meadow
- Decrease in Water

Projected Climate Change - LP, 1978 (High)

Warm and Dry

Wetland Communities

Projected Change (-0.81 m)

- Increase Emergent, Treed Vegetation
- Decrease in Water
- Lakeward Migration

Projected Climate Change - LP, 1964 (Low)

Historic Base Case

Wetland Communities

Projected Climate Change - LP, 1964 (Low)

Not as Warm and Wet

Wetland Communities

Projected Change (-0.15 m)

- Increase Meadow, Treed Vegetation
- Decrease in Water

Projected Climate Change - LP, 1964 (Low)

Not as Warm and Dry

Wetland Communities

Projected Change (-0.55 m)

- Increase in Meadow, Treed
- Decrease in Water, Emergent
- Lakeward migration

Projected Climate Change - LP, 1964 (Low)

Warm and Wet

Wetland Communities

Projected Change (-0.67 m)

- Small Increase in Meadow, Treed
- Decrease in Water, Emergent

Projected Climate Change - LP, 1964 (Low)

Warm and Dry

Wetland Communities

Projected Change (-0.81 m)

- Increases in Treed
- Decrease in Water, Emergent, Meadow
- Lakeward Migration

Modelling Problems and Considerations

- **Accurate elevation data is key!** Insufficient nearshore data
 - Model accuracy varies depending on available elevation data
 - Topographic model used to derive input grids
- Other considerations
 - No additional variables included in model (i.e., existing vegetation, soil/substrate)
 - No rules for fen and alvar communities for Lake Huron

Missing Data - Turkey Point

Great Lakes Coastal Wetland Communities: Vulnerabilities to Climate Change and Response to Adaptation Strategies

Climate Change Action Fund - Coastal Zone Project

INTRODUCTION

The Canadian Wildlife Service and the Adaptation and Impacts Research Group of Environment Canada have secured funding for a two-year project on Great Lakes Coastal Wetland Communities.

In partnership with Fisheries and Oceans Canada and the University of Waterloo, the project examines the vulnerability of coastal wetland plant, bird and fish communities to climate variability and change, and explores adaptation strategies to maintain ecosystem function and values.

Project Proposal

From l-r: Turkey Point Marsh, Big Creek NWA, Long Point Inner Bay, Long Point Provincial Park, Big Creek NWA, Turkey Point Hunt Club (AIRG)

VEGETATION COMMUNITIES

To help develop the wetland plant community vulnerabilities and vegetation response model, supplemental information was required regarding traits that make aquatic plants vulnerable to hydrologic variability. There are over 450 species of plants that regularly occur in Great Lakes wetlands.

Giant Burreed (Glen Barrett), Buttonbush (CWS), Cattail (CWS)

Literature review and expert opinion were used to determine the vulnerability of selected wetland plant species to hydrologic change. Plants were selected based on the most common species occurring in Lake Ontario coastal wetlands during extensive field surveys in the summer of 2003. Plants designated as Species at Risk in Canada were also considered. Several plant growth requirements and life history traits were determined to be important in evaluating how a plant would react to changes in hydrology. A "vulnerability" score was calculated for each species based on the unique combination of scores from this series of factors. The detailed literature review and vulnerability assessment methodology are found below.

Some interesting trends emerged (Figures 1 to 5). Species that are least vulnerable include many invasive species such as *Lythrum salicaria* (purple loosestrife), *Phragmites australis* (common reed), and *Hydrocharis morsus-ranae* (European frogbit). Highly vulnerable species include the turbidity-sensitive *Zizania palustris* (wild rice) and *Potamogeton hillii* (Hill's pondweed), a species of Special Concern in Canada.
